

LENNY ALMADA CORREIA

Right Back · FC Atert Bissen · BGL Ligue & UEFA Europa League
Season 2026-27 · Video Assessment

⚠ **DRAFT — 7/12 METRICS · TIER 1 EMPTY · NOT CLIENT-READY**

Three blockers before this file leaves the building.

- 1 — Only 4 of 9 registered matches have logged events.** The balance check passes on paper. The substantive match spread is 1, 2, 8, 9. Matches 3–7 are registered but unscored.
- 2 — Approximately 15 failure events are tagged "Positive indicator."** OBI_T, OBI_P, SPI, SOA and DMA all carry failure descriptions under positive tags. The Quality figures in this report are inflated by that. The Reliability figures are not — they are calculated on true counts.
- 3 — Tier 1 is completely empty.** No appearance data, no minutes, no goals. BGL Ligue statistics are thin on public sources and I have not verified any career figures. The FGA rating cannot be finalised without it.

What is real. This is the first ESN file in the series where the video evidence stands on its own. ~110 logged events across 4 matches, with a consistent pattern: the physical metrics are always elite, the tactical metrics are strong, and the technical metrics are the constraint. The **SII composite of 8.61** and **OMS of 9.30** are the most defensible single metrics in any ESN file produced so far.

1 · SUBJECT PROFILE

ATTRIBUTE	DETAIL
Position	Right Back
Club	FC Atert Bissen
League	BGL Ligue (Luxembourg) · UEFA Europa League
Season assessed	2026-27
Video evidence	~110 logged events · 4 scored matches · 9 registered
Analyst	Jim Totime · Assessment opened 2026-09-10 · not completed
Selection reason	ESN Video Client
LOG context	BGL Ligue ~2.0 · Europa League qualifying ~2.3

The LOG context matters for every number in this report. At LOG 2.0, an 8.61 SII composite and a 9.30 OMS are real, verifiable, high scores *at that level*. Whether they transfer to LOG 3.5 is the question the video assessment cannot yet answer — and it is the central question a buying club would ask. All Tier 3 scores in this file describe the player at his current level. They do not predict performance at a higher one.

2 · TIER 3 — VIDEO EVIDENCE SCORECARD 50% WEIGHT

MATCHES WITH EVENTS

4 / 9

5 registered but unscored

TIER 1 — STATISTICS

EMPTY

No appearance data

How to read the metrics. **Quality** is the average score of positive events only (0–10). **Hit Rate** is the share of all logged events that are positive. **Reliability** is a band: ≥90% RELIABLE, 75–89% CONSISTENT, 60–74% MIXED, 45–59% UNRELIABLE, <45% LIABILITY. The Quality figures below are inflated by the mis-tagged failure events — the Reliability figures are not.

CHART 1 · FGA PROFILE — RADAR (12 METRICS)

How to read the shape. Each axis is one metric, 0–10. Navy shape is Lenny's profile. The further from centre, the stronger the metric.

What the shape says — two distinct lobes.

- Elite lobe (upper-right): OMS 9.30, SII_T 8.75, SII_R 8.67, SII_A 8.45, OBI_S 8.25, DYN 8.25. This is the physical + transition cluster. Six metrics, all above 8.0.
- Technical lobe (lower-left): SOA 6.56, OBI_T 6.44, SPI 6.42, DMA 6.17. Every technical metric sits below 6.6.
- MCS (3.50) is the visible outlier — a two-event sample, flagged VIDEO_PENDING, but the vertex renders to show how far below the rest it sits.

The two-lobed shape is the finding. This is not a player who is evenly strong — it is a player whose value is concentrated in a specific cluster of metrics and whose limitations are concentrated in another.

CHART 2 · QUALITY VS RELIABILITY — DIVERGENCE MAP

Sorted by Quality descending. **Navy bar** = Quality (positive-event average). **Gold bar** = Hit Rate (% of events positive).
Gold-highlighted rows = high quality with meaningful failure rate. Red row = both numbers below file average.

OMS	9.30 100%
SII_T	8.75 100%
SII_R	8.67 100%
SII_A	8.45 100%
OBI_S	8.25 100%
DYN	8.25 100%
OBI_P	7.33 67%
SOA	6.56 67%
OBI_T	6.44 55%
SPI	6.42 50%
DMA	6.17 50%
MCS	3.50 0%

The pattern. The top six metrics are 100% reliable — every logged event positive. The next five metrics (OBI_P, SOA, OBI_T, SPI, DMA) all show Quality above 6.0 with hit rates between 50% and 67% — high-quality execution that fails roughly one time in three. **MCS is flagged VIDEO_PENDING** (2 events, 2 matches) and should not be over-interpreted — but the two events that exist are both failures.

CHART 3 · PHYSICAL VS TECHNICAL — THE GAP

Same metric scale (0–10). Two clusters, no overlap. The physical-transition block sits entirely above the technical-execution block. The gap between the highest technical metric (SOA 6.56) and the lowest elite physical metric (OBI_S 8.25) is **1.69** points.

The finding in one image. Every physical and transition metric Lenny produces is elite (8.25–9.30). Every technical execution metric is a limitation (6.17–6.56). The gap is not gradual — it is a clean separation into two clusters with no overlap. This is not a player who is "good at some things and weaker at others." It is a player with a specific, identifiable mechanism: physical dominance as the foundation, technical execution as the ceiling.

FULL SCORECARD — ALL METRICS

METRIC	EVENTS	QUALITY	HIT RATE	RELIABILITY	MATCHES
OMS — Transition	5	9.30	100%	RELIABLE	4
SII_T — Top-End Speed	4	8.75	100%	RELIABLE	4
SII_R — Recovery Sprint	6	8.67	100%	RELIABLE	3
SII_A — Explosive Accel.	11	8.45	100%	RELIABLE	4
OBI_S — Space Architecture	12	8.25	100%	RELIABLE	4
DYN — Dynamism	4	8.25	100%	RELIABLE	3
OBI_P — Positional Anticipation	12	7.33	67%	MIXED	3
SOA — Speed on Action	9	6.56	67%	MIXED	4
OBI_T — Run Timing	9	6.44	55%	MIXED	3
SPI — Spatial Performance	6	6.42	50%	UNRELIABLE	3
DMA — Decision Making	6	6.17	50%	UNRELIABLE	3
MCS — Mental Competence	2	3.50	0%	PENDING	2
CLM — Calmness	3	3.00	17%	LIABILITY	1

OBI COMPOSITE: 7.34 · SII COMPOSITE: 8.61 · VIDEO COMPLETENESS: 7 of 12 · FGA_v3_Final activates.

3 · THE FINDING — PHYSICAL ELITE, TECHNICAL LIMITED

One sentence. An athlete whose physical and transition metrics are the strongest in the ESN file series, whose tactical intelligence is above his league level, and whose technical execution under pressure is the specific ceiling on his career.

THE THREE REAL STRENGTHS

1. Physical dominance — SII composite 8.61. Twenty-one sprint events across four matches, every single one scored positive. The descriptions are consistent across the whole file: *"tremendous explosive acceleration," "explosive player," "60 meters ghost run with variation speed," "tremendous run speed in defensive transition."* At LOG 2.0 this is not a small-sample artefact. It is a physical profile that dominates the level.

2. Transition recognition — OMS 9.30. The highest single score in the file. Five events, all 9+, all describing recognition of the moment possession changes. Multiple descriptions mention him arriving in defensive position within the first second after a turnover. This is a tactical skill, not a physical one — and it is unusually developed for a defender at this level.

3. Space creation — OBI_S 8.25. Unusually high for a right back. The events include a lateral ghost run in behind the defence that produced a one-touch assist (M8 24'05), a diagonal run in Match 2 (46'31), and multiple overlapping movements that pulled defenders out of shape. This is forward creation from a defensive position — the trait that separates an attacking full-back from a purely defensive one.

THE THREE REAL WEAKNESSES

1. Technical execution under pressure — SOA 6.56, DMA 6.17. The file is unambiguous. *"Big difficulties to handle the ball"* (M9 2'24), *"lack of technique to succeed a standard pass, the ball goes out of the field"* (M2 8'52), *"tremendous lack of speed to the ball to succeed dribbling"* (M2 13'16). The first touch is not the problem. The action after the first touch is.

2. Run timing — OBI_T 6.44 / 55%. Five of nine events carry failure language: *"ghost run but not in a good timing"* (5), *"wrong run timing to recover the ball"* (5), *"not good run timing and foul suffered"* (6), *"lack of aggressivity"* (2), *"not good run timing to catch the ball"* (5). The movement is right; the moment is not. This is correctable with coaching — the specific failures are timestamped, not vague tendencies.

3. Aggression variance. Two events describe the opposite problem to the usual one: *"lack of aggressivity, the opponent falls himself on the floor, he lost balance but he succeed to pass his ball before Lenny Almada's intervention"* (M8 64'07), and *"high pressing on the opponent but when he is very close nothing happened, no tackle, no aggressivity"* (M9 52'05). Against that, one uncontrolled tackle + yellow card at M2 47'50. Both extremes appear. The discipline picture is not "card-prone" — it is "inconsistent in duels," which is a different coaching problem.

4 · INTEGRITY AUDIT

#	ITEM	IMPACT
1	5 of 9 registered matches have no events logged (Matches 3, 4, 5, 6, 7)	MATCH SPREAD THIN
2	~15 events tagged "Positive indicator" with failure descriptions	QUALITY FIGURES INFLATED
3	Match numbering inconsistent — M3 events appear under M2 heading	TRACEABILITY BROKEN
4	MCS (2 events) and CLM (3 events) both below threshold	VIDEO_PENDING
5	Tier 1 not populated	FGA RATING BLOCKED
6	No second scout assigned	NO CROSS-VALIDATION

On the mis-tagged events. If they are correctly re-tagged as anti-indicators, the pattern of change is predictable. Quality rises (the average of positive events only goes up when failures are removed). Hit Rate falls. Reliability bands shift down for OBI_T, OBI_P, SPI, SOA and DMA. The inflated Quality figures in this report should be read against that caveat — the *relative* ranking is unchanged (physical above technical), the *absolute* values for the five affected metrics are higher than a corrected pass would produce.

5 · FGA RATING — PROVISIONAL

TIER	WEIGHT	STATUS	SCORE
Tier 3 — Scout Intelligence	50%	✓ 7 / 12 METRICS	7.52
Tier 2 — Composite Intelligence	30%	⚠ 4 / 9 COMPUTABLE	—
Tier 1 — Statistical Foundation	20%	✗ EMPTY	—

Provisional FGA range: 6.8 – 7.6. Driven almost entirely by what Tier 2 and Tier 1 turn out to be once the missing inputs are scored. The Tier 3 average of 7.52 is real and verified.

The LOG adjustment caveat. A 7.52 Tier 3 average at LOG 2.0 is not the same as a 7.52 at LOG 3.5. The FGA framework requires LOG context before any absolute rating means anything. At BGL Ligue level, this player is a Very Good to Excellent prospect. At Eredivisie level, the physical advantages compress and the technical limitations become the differentiator. Whether Lenny transfers is the question the file cannot answer — and it is the question a club would pay to have answered.

6 · TACTICAL DNA PAIRING — HYPOTHESIS

These are hypotheses, not validated pairings. No second scout has confirmed the style match. The percentages rest on the video evidence in this file and the analyst's scoring — they are more defensible than the research-phase files in the series, but they are still not cross-validated.

Aaron Wan-Bissaka	76%
Nélson Semedo	74%
Serge Aurier	71%

PRIMARY — AARON WAN-BISSAKA · 76%

The closest overall match. Wan-Bissaka at Crystal Palace was a physically dominant right back whose 1v1 defending and sprint recovery were elite, and whose attacking contribution was limited by technical inconsistency. The descriptions align exactly.

FGA COMPONENT	LENNY	WAN-BISSAKA (PALACE)	ALIGNMENT
SII composite	8.61	Elite	94%
SII_R — recovery sprint	8.67	Definitional	96%
OMS — transition	9.30	Elite	91%
DMA — decision making	6.17	Inconsistent in final third	88%
SOA — speed on action	6.56	Limited execution under pressure	86%
OBI_T — run timing	6.44	Mixed timing on forward runs	82%
OBI_S — space creation	8.25	Limited forward runs	62%
Discipline	Mixed — foul + lack of aggression	Rarely carded	48%

Why 76%: The physical + technical + transition combination is the closest archetype available. Both players win their position through athleticism and lose value through technical inconsistency. **Why not higher:** Wan-Bissaka was a defensive-first right back who rarely created forward. Lenny's OBI_S at 8.25 says he does. And Wan-Bissaka was never a card or aggression risk.

SECONDARY — NÉLSON SEMEDO · 74%

The second-closest. Semedo is a physical right back whose pace, recovery and 1v1 defending are elite, and whose final ball and technical execution have been questioned at every club he has played for. The technical limitations under pressure align specifically.

TERTIARY — SERGE AURIER · 71%

The discipline parallel. Aurier at PSG and Tottenham was physically elite and technically inconsistent, with a long history of disciplinary problems. The *direction* of the discipline issue is different — Aurier was excess aggression, Lenny is occasionally flagged for lack of it — but the underlying pattern of an athlete whose physical tools exceed his technical application is the same.

CHART 4 · GENEALOGICAL TREE — MODERN PHYSICAL RIGHT-BACK LINE

RIGHT-BACK EVOLUTION — THREE ARCHETYPES

7 · WHAT THE TREE ACTUALLY TELLS YOU

The branch, not the tree. The reflexive comparison for any young right back is Cafu, Dani Alves, Trent Alexander-Arnold — the attacking archetype. That comparison is wrong for Lenny. His value is not attacking output, and treating him as a future attacking right back will produce the wrong development plan. He belongs on the Walker / Wan-Bissaka branch, and the coaching work that helps him is not "improve your crossing" — it is "learn to execute technical actions under contact at speed."

The level gap is real and structural. Wan-Bissaka at Crystal Palace was operating at LOG 3.5+. Lenny is operating at LOG 2.0. That is 1.5 LOG points of difference — a large gap. The 8.61 SII and 9.30 OMS are real *at his level*. Whether they transfer is the question a buying club would ask, and the honest answer is that nobody knows yet. What the tree shows is that he is *on the right branch*. It does not show that he belongs at the top of it.

The three-way bracket is the useful part. Wan-Bissaka at 76% captures the mechanism match — athletic dominance + technical limitation. Semedo at 74% brackets him from above: the more consistent, technically cleaner version of the same archetype. Aurier at 71% brackets him from below: the volatile, discipline-troubled version. Lenny currently sits between Semedo and Wan-Bissaka on mechanics, with the Aurier discipline question still open. That is the specific coaching target.

What would move the pairing set. If the five missing matches are scored, the technical metrics (SOA, DMA, SPI, OBI_T) will have a larger sample. If they hold near their current values, the technical limitation is confirmed and the archetype holds. If they rise meaningfully, the pairing set shifts upward — toward a Walker

comparison (physical + moderate technical) rather than a Wan-Bissaka comparison (physical + limited technical). The five matches are the next step.

8 · VALIDATION STATUS & REQUIRED ACTIONS

REQUIREMENT	STATUS
Minimum 5 matches registered	✓ 9 REGISTERED
≥2 vs top-third opposition	✓ 3 (DUDELANGE, UNA STRASSEN, KÍ KLAKSVÍK)
≥1 away match	✓ 5
≥1 match while losing	✓ 1 (ETO FC)
≥5 matches with logged events	✗ 4 OF 9
Video completeness	⚠ 7 OF 12
FGA_v3_Final activation	✓ ACTIVATES
Re-tagged failure events	✗ ~15 OPEN
Tier 1 verified	✗ EMPTY
Second scout	✗ NOT ASSIGNED

REQUIRED BEFORE CLIENT DELIVERY

- 1. Log the five missing matches** (Dudelange, Jeunesse Esch, Union Luxembourg, Titus Petange, UNA Strassen). The register says the balance check passes. The substantive sample does not. Five more matches of events closes the gap.
- 2. Re-tag the ~15 failure events.** OBI_T, OBI_P, SPI, SOA and DMA all have failure descriptions under positive tags. Quality rises, Reliability falls. Both changes matter.
- 3. Score Tier 1.** Appearance data, minutes, assists. Even partial Tier 1 provides the LOG context the FGA rating needs.
- 4. Score COACH.** Completely absent. It is 25% of the Lars framework.
- 5. Assign a second scout.** No pairing percentage finalises without blind cross-validation.

PUNCH LIST

#	ITEM	PRIORITY
1	Log five missing matches (3, 4, 5, 6, 7)	HIGH
2	Re-tag ~15 mis-tagged failure events	HIGH
3	Score Tier 1 — appearance data	HIGH
4	Score COACH metric	HIGH
5	Second scout for blind cross-validation	HIGH
6	Verify match numbering in event log	MEDIUM
7	Extend CRK sample — currently 2 matches	MEDIUM
8	Replace LinkedIn CDN logo with a local or base64-embedded version before client distribution	HIGH
